## ABSTRACT

To provide a Cu-based amorphous alloy having a glassforming ability higher than that of a Cu-Zr-Ti amorphous alloy
and a Cu-Hf-Ti amorphous alloy, as well as excellent
workability and excellent mechanical properties without
containing large amounts of Ti.

A Cu-based amorphous alloy characterized by containing 90 percent by volume or more of amorphous phase having a composition represented by Formula:  $\text{Cu}_{100-a-b}(\text{Zr},\text{Hf})_a(\text{Al},\text{Ga})_b$  [in Formula, a and b are on an atomic percent basis and satisfy 35 atomic percent  $\leq$  a  $\leq$  50 atomic percent and 2 atomic percent  $\leq$  b  $\leq$  10 atomic percent], wherein the temperature interval  $\Delta Tx$  of supercooled liquid region is 45 K or more, the temperature interval being represented by Formula  $\Delta Tx = Tx - Tg$  (where Tx represents a crystallization initiation temperature and Tg represents a glass transition temperature.), a rod or a sheet having a diameter or thickness of 1 mm or more and a volume fraction of amorphous phase of 90% or more can be produced by a metal mold casting method, the compressive strength is 1,900 MPa or more, the Young's modulus is 100 GPa or more, and the Vickers hardness is 500 Hv or more.
